GENERAL FEATURES

Modern machinery with increasingly complex circuits often needs combinations of separate and independent movements. POLARIS 10 and POLARIS 20 flow dividers provide technically advanced, low cost power transmission and solve application problems wherever hydraulic flow has divided. In line with our policy of simplifying the design of hydraulic circuits, our flow dividers have relief valves built into limit pressure and prevent cavitation.

These components permit hydraulic circuits to be cleverly optimised and reduce installation costs. The POLARIS flow dividers are two or more section dividers with a common internal connecting shaft. This maintains a constant ratio between the flows through each section in accordance with section displacement. Theoretical working of rotary flow dividers do not dissipate energy in fact if the outlet pressure of one section drops below input pressure, that section operates as a motor and takes energy from the fluid. This energy is not wasted but transferred by the common shaft to the other sections which operate as pumps and therefore need outlet pressure to be greater than inlet pressure. In working conditions, overall efficiencies depend on the sum of the single sections efficiency.

These products can therefore be used as flow equalizers, flow dividers and pressure intensifiers as shown in the table below.

Outlet pressure	Sections with same displacement	Sections with different displacement
Same	Flow equalizers	Flow dividers
Different	Flow equalizers	Flow dividers
	Pressure intensifiers	

DISPLACEMENTS

From 0.122 in³/rev (2 cm³/rev)

To 1.99 in³/rev (32,6 cm³/rev)

PRESSURE

Max. continuous 3600 psi (250 bar)

Max. peak 4000 psi (280 bar)

- Modular design
- Accurate division of flow
- Compact overall dimension
- Built-in relief valve

Casappa consiglia i filtri della propria produzione:

GENERAL FEATURES OF RELIEF VALVES

Relief valves allow the actuators to realign at the end of each cycle in both flow directions. As an example when the cylinders extend, they may not all reach their end stops exactly at the same time. In this case as soon as one cylinder reaches its stop, the relief valve in that section directs fluid to tank until all the other cylinders reach their stops. While retracting the relief valve acts as check valve and opens to prevent cavitation.

Relief settings valve and their identification code are listed in the table below.

Stamp code	Δp nominal setting 2.64 US gpm (10 l/min)	Δp minimum begin opening valve
	psi (bar)	psi (bar)

p_1 = Max. continuous pressure

p_2 = Max. peak pressure

(1): Pressure intensifiers can work at high pressure between sections.

For working conditions outside the recommended limits shown in the table, please consult our sales department.

	Max. flow for inlet section
	l/min
PLD 10	9.25 US gpm (35 l/min)
PLD 20	21.14 US gpm (80 l/min)

03/01.2013

The diagram illustrates a hydraulic system with two parallel pumps, $p1Q1$ and $p2Q2$, feeding into a common outlet. The system is enclosed in a dashed rectangular boundary. At the top, two vertical cylinders represent reservoirs. Below them, the pumps $p1Q1$ and $p2Q2$ are shown. Each pump is connected to a vertical line with a check valve pointing upwards. These lines merge into a horizontal line that leads to a series of three pumps: $V1$, $V2$, and V_n . The output of V_n is indicated by a dashed arrow pointing upwards. Below the dashed boundary, a pump $p0Q0$ is shown with a check valve pointing upwards towards the main line. A pump V_0 is connected to the line below $p0Q0$. The entire system is connected to a common outlet at the bottom.

$$V_{(\dots)} = \frac{1000 Q_{(\dots)}}{n}$$

DISPLACEMENT SELECTION GUIDE

PLD 10

PLD 20

Performance range

Optimum performance range

Each curve has been obtained at 122°F (50°C), using oil with viscosity 212 SSU (36 mm^2/s) at 104°F (40°C).

FLOW DIVIDERS (WITH UNEQUAL DISPLACEMENTS)

Flow dividers are used where the same pump must drive several different actuators requiring different pressures and flow rates. The displacement of each section must be proportional to the flow rate required by the actuator to which it is connected. Two typical circuit diagrams of applications where flow dividers are utilized will be found on page 11.

V	in ³ /rev (cm ³ /rev)	Displacement
Q	US gpm (l/min)	Flow
p	psi (bar)	Pressure
n	min ⁻¹	Speed

$$Q_0 = Q_1 + Q_2 + Q_n$$
$$p_0 Q_0 = p_1 Q_1 + p_2 Q_2 + p_n Q_n$$
$$V_{(...)} = \frac{1000 Q_{(...)}}{n}$$

DISPLACEMENT SELECTION GUIDE EXAMPLE

Assume two actuators must be driven using 13.2 US gpm (50 l/min) and 5.3 US gpm (20 l/min) respectively. To find the displacement of the flow divider sections, simply locate the flow rates in question on the Y axis and then move across horizontally until the lines corresponding to the displacement are encountered. Select a displacement with points of intersection aligned as near as possible vertically, and the nearest to the maximum speed in optimum performance range.
